GenAIBIZ Questions

Question 3: You've been generating images of people, and for the most part, you've been getting good results. However, many of the outputs show people wearing hats, which you don't want. What prompt-engineering technique can you use to guide the model into not generating people wearing hats?

Option 1: (●) Add a negative prompt: 'hat'.

Option 2: ( ) Add a weighted prompt: '(hat:1.3)'.

Option 3: ( ) Change the aspect ratio during image generation from 1:1 to 3:2.

Option 4: ( ) Apply image interrogation to the images without hats, then use those outputs as text prompts.

Question 4: Which of the following scenarios involves using A/B testing to evaluate the results of a text-generation solution?

Option 1: ( ) Compare the time it takes for a human to respond to a query with the time it takes for an AI to respond to that same query.

Option 2: ( ) Deliver exit surveys to users asking them to rate their interactions with the AI. Then, compare the results to a baseline acceptable score.

Option 3: ( ) Present two responses to each user: one from a human, and one from an AI. Ask the users to rate each.

Option 4: (●) Show half the users a response generated by an AI, and the other half a response generated by a human. Collect feedback on both and compare.

Question 5: You want to generate a realistic voice that can speak some lines to people as they walk into your place of business. Which of the following text prompts would be most appropriate to input to a speech-synthesis tool?

Option 1: ○ 'a middle-aged man, deep voice, cheerful'

Option 2: ○ 'Greet new people at the door.'

Option 3: ◉ 'Welcome! Please sign in at the reception desk.'

Option 4: ○ 'Send people to reception if they aren't wearing an employee badge.'

Question 6: You have a block of code that fails to run, and the error message is not particularly helpful. You decide to paste this block of code into a chatbot to see if it can explain the problem and then fix the code. What code-generation approach are you using?

Option 1: ○ Code completion

Option 2: ○ Code testing

Option 3: ◉ Code debugging

Option 4: ○ Code refactoring

Question 7: Which of the following best demonstrates how an organization can convince its stakeholders that it has fulfilled the "social" component of environmental, social, and governance (ESG) initiatives for AI?

- Option 1: (●) Outline how the AI solution upholds ideals like fairness, equity, and inclusion.
- Option 2: ( ) Explain how the AI solution is incapable of harming at-risk communities.
- Option 3: ( ) Clarify how the AI solution encourages users to socialize with one another.
- Option 4: ( ) Describe the strengths of the AI solution and how they outweigh any social impacts it might have.

Question 8: A colleague mentions that a recently announced large language model (LLM) has 300 billion parameters. What does this mean?

- Option 1: ( ) The model has 300 billion layers in its neural network.
- Option 2: (●) The model has 300 billion connection weights in its neural network.
- Option 3: ( ) The model was trained on 300 billion tokens.
- Option 4: ( ) The model is able to produce 300 billion unique outputs.

Question 9: In most jurisdictions, who owns the copyright to a work that was generated by an AI?

- Option 1: ( ) The copyright holders of the images that were used to train the model.
- Option 2: ( ) The company that owns and operates the model.
- Option 3: ( ) The user who prompted the model to generate the work.
- Option 4: (●) There is not yet widespread legal precedent regarding who owns the copyright.

Question 10: Which of the following is an example of generative AI exhibiting bias in its outputs?

Option 1: ○ A text-generation model is prompted to summarize a news article, and its summary mentions the gender of the subject(s) of that article.

Option 2: ○ A chatbot switches to using a different language when it detects what country the user is connecting from.

Option 3: ○ An audio-generation model is used to clone someone's voice without their consent.

Option 4: ◉ An image-generation model, when prompted to simply generate 'a businessperson,' produces images of people who are all the same race.

Question 11: You have an image of a mountain that you'd like to use in a promotional post on social media. However, the image doesn't fully encompass the mountain—it's cut off at both edges of the image. What image-generation technique can you use to widen the image and draw the rest of the mountain, without changing what's already in the image?

Option 1: ○ Upscaling

Option 2: ○ Inpainting

Option 3: ◉ Outpainting

Option 4: ○ Composition control

Question 12: You want to develop a custom chatbot that can communicate with customers. The chatbot must rely on a third-party, large language model (LLM) hosted by a cloud provider. As you investigate your options, what should you look for in this cloud provider?

Option 1: ○ The availability of a flat subscription fee.

Option 2: ○ The availability of a web-based chatbot hosted by the cloud provider.

Option 3: ◉ The availability of an API that can connect your app to the LLM.

Option 4: ○ The availability of a multimodal approach to generating outputs.

Question 13: Which of the following ethical principles is directly undermined by so-called "black-box" machine learning models?

Option 1: ○ Fairness

Option 2: ◉ Explainability

Option 3: ○ Privacy

Option 4: ○ Safety

Question 14: In which of the following ways will generative AI impact the future of work?

Option 1: ○ Generative AI will lead to major job displacement in the short term.

Option 2: ○ Workers will be able to rely on automated systems without needing to exercise their own judgment.

Option 3: ◉ Business professionals will need at least a basic understanding of generative AI and experience using it.

Option 4: ○ Employers will need to hire deep learning engineers to stay competitive.

Question 15: Which of the following is a major disadvantage of relying on cloud services to facilitate generative AI compared to an on-premises solution?

Option 1: ◉ You do not have direct control over the service(s) provided by the cloud vendor.

Option 2: ○ Servicing generative AI inputs and outputs is slower in the cloud.

Option 3: ○ Cloud services cannot adequately meet sudden increases in demand.

Option 4: ○ The cost of using a cloud-based generative AI service is higher.

Question 16: Which of the following tasks is an example of keeping "humans in the loop"?

Option 1: ◉ An auditor periodically reviews the outputs of a generative AI model to detect issues.

Option 2: ○ A user asks a chatbot a question.

Option 3: ○ A user creates a sketch of an image, then sends that sketch to a generative AI model so it can fill out the rest of the image.

Option 4: ○ A developer writes code that accesses a generative AI model through an API.

Question 17: Which of the following aspects of a dataset is NOT provided to an unsupervised learning algorithm?

Option 1: ○ Examples

Option 2: ◉ Labels

Option 3: ○ Features

Option 4: ○ Test data

Question 18: How can a code-generation AI help enhance someone's programming skills?

Option 1: ○ The AI could write a production-ready application for the user based on a simple set of requirements.

Option 2: ◉ The AI could accept a block of the user's code in a prompt, then provide real-time feedback on that code block, pointing out any mistakes or areas for improvement.

Option 3: ○ The AI could run the user's compiled program, identify performance issues, then output a version that has better performance.

Option 4: ○ The AI could interface with the user's integrated development environment (IDE) and complete the user's code as they type it.

Question 19: You instruct a text-generation model to summarize text in a prompt. You also provide various stipulations for how the text should be summarized. However, the model is including these stipulations in the summary. What prompt-engineering technique can you use to help the model distinguish between the text to be summarized and the instructions?

Option 1: ◉ Delimiters

Option 2: ○ Zero-shot prompting

Option 3: ○ Role assignment

Option 4: ○ Condition validation

Question 20: You want to develop an app that will help users place online orders. You want the app to be able to hold a conversation with the user as they are placing their order. Which text-generation approach would be most appropriate?

Option 1: ○ Instruction following

Option 2: ○ Transcription

Option 3: ○ Text completion

Option 4: ◉ Chatbot

Question 21: Which of the following would be a useful key performance indicator (KPI) for evaluating the quality of outputs from an image-generation model?

Option 1: ○ The number of times the model failed to output an image.

Option 2: ◉ A score from 1 to 10 that indicates how realistic the user thinks the image is.

Option 3: ○ The time it takes for the model to generate an acceptable image.

Option 4: ○ Whether or not the image resolution matches what was specified in the prompt.

Question 22: Which of the following is an example of the generative AI phenomenon known as confabulation (aka hallucination)?

Option 1: ○ The AI outputs text that exhibits bias because it was not trained on properly representative data.

Option 2: ◉ The AI outputs false information despite being trained on trustworthy sources of text.

Option 3: ○ The AI fails to output images in a certain artist's style because it was not trained on images from that artist.

Option 4: ○ The AI refuses to output text that discusses a specific person, despite having been trained on news articles about that person.

Question 23: You want to generate background music for a video advertisement. The ad is promoting a new model of pickup truck. Which of the following text prompts would be most likely to produce the desired results?

Option 1: ○ 'a new pickup truck, all-wheel drive, four-cylinder engine, spacious interior, silver color'

Option 2: ○ 'car commercial'

Option 3: ○ 'rock music'

Option 4: ◉ 'rock music used in a car commercial, driving drum beat, energetic, soaring vocals, mid tempo'

Question 24: Which of the following generative AI techniques is used to retrain a foundational model on new, labeled data?

Option 1: ○ Prompt engineering

Option 2: ○ Reinforcement learning from human feedback (RLHF)

Option 3: ○ Latent representation

Option 4: ◉ Fine tuning

Question 25: Which of the following is an example of generative AI?

Option 1: ○ A system that scans an image and identifies the people in that image.

Option 2: ○ A system that determines the severity level of network traffic and then blocks traffic that exceeds a certain threshold.

Option 3: ◉ A system that summarizes the contents of an email message in a single sentence.

Option 4: ○ A system that controls the movements of a welding robot on an assembly line.
