User prompt: Service Level Agreement

Response: A **Service Level Agreement (SLA)** is a formal, legally binding or operational contract between a service provider and a customer. It defines the specific quality, availability, and responsibilities expected during the service delivery, along with remedies or penalties if those standards are not met.

Core Components of an SLA

Component	Description	Example
Scope & Services	Defines exactly what services are provided and supported.	"24/7 Monitoring and Management of Cloud Infrastructure."
Performance Metrics	Quantifiable indicators used to measure service quality.	Uptime, Latency, Throughput, Response Time.
Service Provider Commitments	Objectives the provider guarantees to maintain.	"99.9% system uptime per calendar month."
Penalties & Credits	Financial or operational compensation if SLA targets are missed.	"10% bill credit if uptime falls below 99.0%."
Customer Responsibilities	Duties required from the client to uphold the agreement.	"Providing timely access to internal server logs during incidents."

Key Performance Metrics

- **Uptime / Availability:** Percentage of time services are operational (e.g., 99.9% uptime allowing a maximum of ~43 minutes of monthly downtime).
- **Mean Time to Respond (MTTRsp):** Time taken to acknowledge a critical issue after it is logged.
- **Mean Time to Resolve (MTTR):** Average time elapsed from issue reporting to resolution.
- **Response Time & Latency:** Speed at which a application or system responds to user requests.

Common SLA Levels (The "Nines" of Availability)

```
+----------------+--------------------------+
| Availability % | Allowed Downtime / Month |
+----------------+--------------------------+
| 99% ("Two 9s") | ~7 hours 18 minutes      |
```

```
| 99.9% ("Three")| ~43 minutes 49 seconds   |
| 99.99% ("Four")| ~4 minutes 23 seconds    |
| 99.999% ("Five")| ~26 seconds              |
+----------------+--------------------------+
```

Types of SLAs

1. **Customer-Based SLA:** Tailored to an individual customer covering all services they use (e.g., an enterprise software contract).
2. **Service-Based SLA:** Standard agreement offered to all customers using a specific service (e.g., standard AWS or Microsoft 365 uptime guarantees).
3. **Multi-Level SLA:** Layered structure addressing global corporate rules, specific customer requirements, and distinct service tiers within one document.
