    •   m:  Quiz

================================================================================
m:  Quiz
================================================================================

Achieving a score of 20 or greater out of 25 means you
    will be GenAIBIZ certified for another year.

>   Question 1:
    Which of the following image-generation techniques
    enables you to change the composition of an existing image
    while retaining other aspects of that image?
<   inpainting

>   Question 1b:
    You want to develop a custom chatbot that can
    communicate with customers.
    The chatbot must rely on a third-party,
    large language model (LLM) hosted by a cloud provider.
    As you investigate your options,
    what should you look for in this cloud provider?
<   The availability of an API that can connect your app to the LLM.

>   Question 2:
    Which of the following generative AI techniques is
    used to retrain a foundational model on new,
    labeled data?
<   Fine-tuning:
    Takes a pre-trained base or foundational model (originally
    trained on vast amounts of unlabelled data
    via self-supervised learning) and
    continues the training process using a smaller,
    task-specific labeled dataset.
    This adapts the model's weights to optimize performance
    for specific tasks like classification,
        sentiment analysis, or domain-specific Q&A.

>   Question 3:
    In which of the following ways will generative AI
    impact the future of work?
<   Business professionals will need at least a basic
    understanding of generative AI and experience using it.

>   Question 4:
    In the context of large language models (LLMs),
        what distinguishes a reasoning model from a non-reasoning model?
<   Reasoning Model (RLM)
    Reasoning models are built to follow a chain of thought
    before responding.

>   Question 5:
    Which of the following would be a useful
        key performance indicator (KPI) for
    evaluating the quality
        of outputs from an image-generation model?
```

```
74   <   The time it takes for the model to generate an acceptable image.
75
76
77   >   Question 6:
78       Which of the following is an example of generative AI
79           exhibiting bias in its outputs?
80   <   An image-generation model,
81       when prompted to simply generate
82       'a businessperson,' produces images of people who are all the same race.
83
84   >   Question 7:
85       Which of the following tasks is an example of keeping
86       "humans in the loop"?
87   <   An auditor periodically reviews the outputs of
88       an agentic AI model to detect issues.
89
90
91   >   Question 8:
92       Which of the following best demonstrates how
93           an organization can convince its stakeholders
94       that it has fulfilled the "social" component of environmental,
95           social, and governance (ESG) initiatives for AI?
96   <   Outline how the AI solution upholds ideals
97       like fairness and non-discrimination.
98
99
100  >   Question 9:
101      Unsupervised learning algorithms are trained without
102          which of the following?
103  <   Labels
104
105
106  >   Question 10:
107      A colleague mentions that a recently announced large
108          language model (LLM) has 300 billion parameters.
109      What does this mean?
110  <   The model was trained on 300 billion tokens.
111
112
113  >   Question 11:
114      You want to generate background music for a video advertisement.
115      The ad is promoting a new model of pickup truck.
116      Which of the following text prompts would be most
117          likely to produce the desired results?
118  <   rock music used in a car commercial,
119      driving drum beat, energetic, soaring vocals, mid tempo'
120
121
122  >   Question 12:
123      Which of the following is an example of generative AI?
124  <   A system that scans an image and identifies the people in that image
125
126
127  >   Question 13:
128      Which of the following is a major disadvantage
129          of relying on cloud services to facilitate generative AI
130      compared to an on-premises solution?
131  <   You do not have direct control over the service(s)
132      provided by the cloud vendor.    [FALSE]
133  <   The cost of using a cloud-based generative AI service is higher.
134
135  >   Question 14:
136      In a large language model (LLM),
137      what does it mean to tokenize a sentence?
138  <   Partition the sentence into meaningful units.
139
140
141  >   Question 15:
142      Which of the following image-generation techniques enables
143          you to change the composition of an existing
144      image while retaining other aspects of that image?
145  <   Inpainting
146
```

```
147
148   >   Question 16:
149       You have a block of code that fails to run,
150           and the error message is not particularly helpful.
151       You decide to paste this block of code into a chatbot to see
152           if it can explain the problem and then fix the code.
153       What code-generation approach are you using?
154   <   Code debugging
155
156
157   >   Question 17:
158       Which of the following scenarios involves using A/B
159           testing to evaluate the results of a text-generation solution?
160   <   Present two responses to each user:
161       one from a human, and one from an AI.
162       Ask the users to rate each.
163   <   Show half the users a response generated by an AI,
164           and the other half a response generated by a human.
165           Collect feedback on both and compare.
166
167
168   >   Question 18:
169       How can a code-generation AI help enhance someone's programming skills?
170   <   The AI could run the user's compiled program,
171       identify performance issues,
172       then output a version that has better performance.
173   <   The AI could interface with the user's integrated
174       development environment (IDE) and complete
175       the user's code as they type it.
176
177
178   >   Question 19:
179       As of 2025, in most jurisdictions,
180           who owns the copyright to a work generated entirely by AI
181           without human authorship?
182   <   There is not yet widespread legal precedent
183           regarding who owns the copyright.
184
185
186
187   >   Question 20:
188       You have an image of a mountain that you'd like to use in a
189           promotional post on social media.
190       However, the image doesn't fully encompass the mountain -
191           it's cut off at both edges of the image.
192       What image-generation technique can you use to
193           widen the image and draw the rest of the mountain,
194       without changing what's already in the image?
195   <   Outpainting
196
197
198   >   Question 21:
199       Which of the following is an example of the generative
200       AI phenomenon known as confabulation (a.k.a. hallucination)?
201   <   The AI outputs false information
202       despite being trained on trustworthy sources of text.
203
204
205   >   Question 22:
206       You want to generate a realistic voice that can speak
207           some lines to people as they walk into your place of business.
208       Which of the following text prompts would
209       be most appropriate to input to a speech-synthesis tool?
210   <   "Welcome! Please sign in at the reception desk."
211
212
213   >   Question 23:
214       You want to use an AI to quickly extract key information
215           from a large set of technical documentation.
216       Which of the following techniques would enable the AI
217           to do this without having to
218           retrain on the documentation or
219           require the user to supply
```

```
220         the documentation in a prompt?
221
222     <   Retrieval-augmented generation (RAG)
223
224
225     >   Question 24:
226         Which of the following ethical principles is directly
227             undermined by so-called "black-box" machine learning models?
228     <   Transparency || Explainability
229
230
231     $<  Why Transparency is Undermined
232         The Black-Box Problem:
233             Complex machine learning models
234             (like deep neural networks or ensemble models)
235             transform input data into predictions through millions
236             or billions of parameters.
237         Because these internal decision-making paths are opaque,
238         humans cannot easily see or comprehend
239         how or why a specific prediction was reached.
240         Impact on Accountability & Fairness:
241             Without transparency,
242         it is extremely difficult to verify whether
243             a model is making decisions based on legitimate
244             factors or discriminatory biases,
245         making it hard to hold the system or its creators accountable for harmful errors.
246
247     >   Question 25:
248             How does agentic AI differ from generative AI?
249     <   Access To Internet.
250
251
252     >   Which of the following is an example of generative AI?
253     <   A system that summarizes the contents of an
254         email message in a single sentence
255     <$  Why it IS Generative AI
256         Primary Task:
257             Content synthesis and text generation.
258         Content Creation:
259             Rather than just extracting a sentence or
260                 labeling the email,
261         the system uses a Large Language Model (LLM)
262             to process the entire message,
263             comprehend its key context,
264         and compose a brand-new,
265         concise sentence that accurately represents the original content.
266
267
268     >   Question 14:
269         In a large language model (LLM),
270         what does it mean to tokenize a sentence?
271
272     <   Split the words in the sentence into two or more parts.
273
274
275     >   Question 17:
276         How does agentic AI differ from generative AI?
277     <    AI has access to external sources of information
278         like Internet search results.
279
```
